Search Notes

Michael,

Searched Seq. ID 5278 using the oligomer parameters. If you were interested in a size limited search, pls. contact me.

Malibu, CA 90265, USA

This clone sequence is one of 5,000 Ceres full-length cDNAs made available to TIGR and Genbank. The following quality assessment of this set was done by comparison with Known proteins: two percent of the clones are estimated to be 5'-truncated; less than one percent are 3'-truncated; approximately two percent represent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the translation initiation start (ATG). A sequence is considered to be 3'-truncated if it lacks the encoded protein. Please note that these cDNA sequences are derived from the Ws or Lace cotypes and therefore may contain polymorphisms when compared to sequences from Col-0. Genset carried out the library production and sequencing of the full-length clones. Ceres, Inc. carried out the clustering of the colcation/Qualifiers

This clone sequence is one of 5,000 Ceres full-length cDNAs made available to TIGR and Genbark. The following quality assessment of this set was done by comparison with known proteins: two percent of the clones are estimated to be 5'-truncated; less than one percent are 3'-truncated; approximately two percent represent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the 5'-truncated if it lacks the sequence is considered to be 3'-truncated if it lacks the ctranslation initiation start (ATG). A sequence are derived from the No r Laker ecotypes and therefore may contain polymorphisms when compared to sequences from Col-0. Genset carried out the library production and sequences from Col-0.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /trānslation="MFLQVHEIAFLFGLLGNIVSFGVFLSPVPTFYGIYKKKSSKGFQ

This clone sequence is one of 5,000 Ceres full-length cDNAs made available to TIGR and Genbark. The following quality assessment of this clones are estimated to be 5.000 Ceres full-length cDNAs made the clones are estimated to be 5.-truncated; less than one percent are 3'-truncated; approximately two percent represent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the framinal end of the encoded protein. Please note that these cDNA sequences are derived from the Ws or LAer ecotypes and therefore may contain polymorphisms when compared to sequences from Col-0. Genset carried out the library production and sequences from Col-0. Genset carried out the library production and sequences from five full-length clones. Ceres, Inc. carried out the clustering of the contain polymorphisms and sequence assembly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /translation="MGVIINHHPLAFIFGILGNVISFLVFLAPVPTFYRIYKRKSTES

The invention relates to a composition comprising a human GDP-mannose 4.6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of cellular fucosylation or diseases affected by the by the level of cellular fucosylation or diseases include arthritis, transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polymucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for or serial molecule antagonists of the activity of the enzyme. The polymucleotide is useful in developing an assay for defects in the enzyme, as well as in gene replacement therapy. Sequences con the invention and M4,6D peptides of the invention did not form part of the printed specification but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; GDP-mannose 4,6-dehydratase; GM4,6D; gene; se; inflammation; cellular fucosylation; glycoconjugate fucosylation; transplant rejection; arthritis; sethma; sepsile; reperfusion injury; stroke; infection; complex carbohydrate; gene replacement therapy; immunosuppressive; antiinflammatory; antiarthritic; antibacterial; cerebroprotective;

The invention relates to a composition comprising a human GDP-mannose 4.6 dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors. GM4 is inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the by the level of cellular fucosylation or diseases affected by the transplant rejection, asthma, sepais, reperfusion injury, stroke or infection. The GM4,6D peptide or a polymucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for creening small molecule antagonists of the activity of the enzyme. The polymucleotide is useful in developing an assay for defects in the conzume, as well as in gene replacement therapy. Sequences

CMARX17942-ABX17944 and ABX17947-ABX33716 represent DNA molecules encoding human GM4,6D peptides of the invention.

CNOTE: The sequence data for this patent did not form part of the printed ancestization but use obtained in developing in the consume discontinued and all for this patent did not form part of the printed ancestization but use of the printed ancestization but use of the printed ancestization but used to the printed ancestization but the patent of the printed ancestization but used to the printed ancestization but used to the printed ancestization and the patent of the printed ancestization ancestization and the patent of the print
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      133 CCATGTCCCACAGTCAAGTTTCGCCTTTGGGATTCTAGGTAACATTGCCTCCTTCG 192

                                                                                                                                                                            The present sequence is that of clone RC8, a 5' cDNA clone cobtained from Petunia hybrida strain W115 by RT-PCR. Clone RC8 and overlapping clone DD18a (See AA25497). Obtained by differential display RT-PCR, were used to generate a full-length cDNA (see AA25493) of a gene termed NEC1. The NEC1 gene is highly expressed in the nectaries of petunia and weakly expressed in the stamens. The present invention provides a method for producing recombinant proteins in honey. The honey is manufactured by insects, preferably honeybees, that collect the nectar of transgenic plants. The NEC1 promoter (see AA253496) can be utilised in expression cassettes for the production of transgenic plants that produce a protein of interest in their nectar.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                     The present sequence is a cDNA encoding nectary-specific protein NBC1.

It was isolated from nectaries of Petunia hybrida strain W115 uaing mRNA Differential Display system. NEC1 resembles membrane protein and is strongly expressed in the nectaries of P. hybrida.

A DNA sequence from the promoter region upstream of nectary-specific expressed sequence e.g. NEC1 and FBP15 DNAB is used in recombinant DNA construct comprising a DNA encoding a metabolite preferably recombinant protein, a DNA encoding a signal peptide that targets the recombinant protein, to the nectar and optionally a signal polyadenylation of an RNA molecule. The DNA construct is useful for producing transgenic plants which excrete recombinant proteins in its nectar. The nectar is processed into honey by insects (preferably bees) and the desired protein is easily recovered from it. The recombinant proteins are useful for pharmaceutical purposes, as enzymes for biotests
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

DNA sequences used to produce modified honey, the metabolites of can be isolated and purified -
                                                                                                                                                                                                                                     cDNA, as produced from 2 overlapping partial clones (see AAZ35497-98) obtained by differential display RT-PCR and RACE PCR. The NEC1 appearenced a 265-amino acid protein (see AAY58647). NEC1 is highly expressed in the nectarise of petunia and weakly expressed in the stamens. The present invention provides a method for producing preforminant proteins in honey. The honey is manufactured by insects, preferably honeybees, that collect the nectar of transgenic plants. The NEC1 gene and its promoter (see AAZ3546) can be utilised in expression cassettes for the production of transgenic plants that produce a protein of interest in their nectar. The function of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a composition comprising a human GDP-mannose 4,6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors. GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of callular fucceylation or diseases affected by the cucsylation of glycoconjugates. These diseases include arthritis, transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polymuclectide encoding it is also useful for manufacturing complex carbohydrates and as targets for screening small molecule antegonists of the activity of the enzyme. The polymuclectide is useful in developing an assay for defects in the caryme, as well as in gene replacement therapy. Sequences

ABX17944 and ABX17947-ABX33716 represent DNA molecules encoding human GM4,6D peptides of the invention.

Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, GDP-mannose 4,6-dehydratase, GM4,6D; gene, ss; inflammation, cellular fucosylation; glycoconjugate fucosylation; transplant rejection, arthritis; asthma; sepsis; reperfusion injury; stroke, infection, complex carbohydrate; gene replacement therapy; immunosuppressive; antiinflammatory; antiarthritic; antibacterial; cerebroprotective;

```

The invention relates to a composition comprising a human GDP-mannose 4.6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors. GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of cellular fucosylation or diseases affected by the level of cellular fucosylation or diseases affected by the cucosylation of glycoconjugates. These diseases include arthritis, transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polynuclectide encoding it is also useful for manufacturing complex carbohydrates and as targets for screening small molecule antagonists of the activity of the enzyme. The polynuclectide is useful in developing an assay for defects in the enzyme, as well as in gene replacement therapy. Sequences

CMBXIT942-ABX1944 and ABX1947-ABX33716 represent DNA molecules encoding human GM4,6D peptides of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-JUN
The invention relates to a composition comprising a human GDP-mannose 4,6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of cellular fucosylation or diseases affected by the fucosylation of glycoconjugates. These diseases include arthritis, transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polymucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for screening small molecule antagonists of the activity of the enzyme. The polymucleotide is useful in developing an assay for defects in the caryme, as well as in gene replacement therapy. Sequence ABX17942-ABX17944 and ABX17947-ABX3316 represent DNA molecules encoding human GM4,6D peptides of the invention.

Specification but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     101 GAGTCTTGGGCTTTTGTCTTCGGCGTTATGGCCAACATCATCTCCTTTGGAGTGTTCCTT 160

Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses

Claim 15; SEQ ID NO 1263; 577pp + Sequence Listing; English.

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising:

(a) contracting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and

(b) detecting a profile of expressed polynucleotides in the plant characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ1136-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed efficiation but is based on sequence information supplied to Derwent by

the European Patent Office.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 623,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 3, Application US/08920812
Patent No. 5763188
GENERAL INFORMATION:
APPLICANT: Ohno, Tsuneya
APPLICANT: Whara, Akio
APPLICANT: Uhara, Hirotsugu
APPLICANT: Eda, Soji
TITLE OF INVENTION: Probe for Diagnosing Infectious Disease
NUMBER OF SEQUENCES: 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 12.0%; Score 30.2; DB 3; Length 662; Best Local Similarity 44.3%; Pred. No. 2.5; Matches 62; Conservative 0; Mismatches 78; Indels

XhoI; The cDNA library was constructed from mRNA isolated
from unexpanded leaves and the shoot tips of 2 week old
seedling from the cultivar Williams. The 2 week old
seedling were salt stressed in a solution of 500mM NaCl
for 3 days prior to harvesting. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
directionally cloned into the BCORI. Startments were
cf the analysers were the lime the EcoRI. Startments were
